Abstract

Aim: The aim of this descriptive study was to assess the severity of symptoms and their impact on quality of life in women with a diagnosis of urogenital prolapse.

Background: Urogenital prolapse symptoms are not life-threatening, but they lead to limitations in work, family and sexual life and deterioration in quality of life. Therefore, when many women experience these symptoms more than once in a week, they realize that their quality of life has been negatively affected.

Methods: The study included a total of 179 women with a diagnosis of urogenital prolapse who applied to the gynecology outpatient clinic of Women’s Health Teaching and Research Hospital, Turkey, July-October 2010. The “Descriptive Information Questionnaire” and “The Prolapsus-Related Quality of Life (P-QOL) Questionnaire” were used to collect data.

Results: In this study, 68.1% of women recruited from the gynecology outpatient clinic were aged 52 and over, and 46.9% had graduated from primary school. 44.1% of women’s parity was 3-4, 97% of women had a history of giving birth vaginally. 72.6% of women were in the postmenopausal period and 29.1% of women had a history of urogenital prolapse in their family. 77.7% of women had not previously applied to a hospital, even though they had experienced symptoms related to urogenital prolapse, 43.6% of women had applied to a hospital concerning urinary incontinence. It was found that 52% of women were diagnosed with cystocele, 57% had a third degree or higher urogenital prolapse.

Urogenital prolapse affects women’s general health perceptions, physical-social activities, personal relationships, quality of sleep.

Conclusion: All women should be educated - consulted about urogenital prolapse for prevention of the disease, early diagnosis treatment.

Key words: Urogenital prolapse, women, quality of life
